## The Healthiest Drinking Water

Dear Duncan: Having been in the alternative health industry for over 36 years now, I have seen products come and go. It is rare indeed to come across a product that not only stands up to scientific scrutiny but works in a practical sense as well. I speak of the Wellness water filter.

My wife and I just renovated our kitchen and decided to install the Wellness unit. We must say that we have never experienced such a joy from just drinking water. We have used and installed many other types of filters over the years with varying degrees of success in obtaining "natural" water with that special taste of fresh clean spring water.

I have always said (and it is now called "Shaw's Law"), "Put nothing in your body unless it is natural and can be found in Nature". The Wellness filter would be the closest thing yet to fulfilling that circumstance.

The above statement is made with good intentions, as the writer feels that every reader of NEXUS should have the opportunity to use a water filter that is really fantastic.

Joshua Shaw, Queensland, Australia, bionic@bigpond.net.au

## Death Threats and Black Gold

NEXUS magazine is currently publishing a two-part continuation of my earlier two-part essay on Project Hammer [see 9/01-02].

I can say with some degree of certainty that my investigation into Project Hammer has caused concern in some quarters. Last Saturday night/Sunday morning, 21/22 June, someone delivered to my house a cheap-fibre briefcase containing a litre bottle of petrol. A further litre bottle of petrol had been opened and poured over the briefcase. Next to it was a box of matches that had been up-ended and tipped out on the floor. Nearby, another box of matches had been similarly strewn about the driveway.

This is the second death threat I have received in the last seven months. Previously, in early November last year, someone delivered to precisely the same spot on my driveway a dead pig's head, a length of rope, a brick (very masonic, à la Roberto Calvi) and a blank bereavement card (and a couple of other items, too).

On at least a dozen occasions—maybe as many as 20, now—the gate leading to the side of my house, which is always kept shut, has been in an open position when my wife and I have returned home from visiting family, etc.

This latest death threat was also reported to the police. Although I was interviewed and lodged formal complaints, the police appear to have been all too casual and have taken no real action.

Project Hammer reveals a decades-old network that indirectly connects to the JFK assassination on one hand and 9-11 on another. But Hammer's principal focus is the gold plundered during WWII by the Japanese and the Nazis and how it has been used since WWII in all manner of covert activities. We are talking about a 60-year-old slush fund that is currently valued in the trillions of dollars.

It is here, in this maelstrom of money, that one can see the convergence of different but not altogether unrelated interests: the intelligence community, organised crime, awfully powerful and wealthy families, transnational businesses and members of the political class.

It just may be that it is this WWII black gold that is the binding thread behind the numerous—but seemingly unconnected—events of past decades.

David Guyatt, UK, website <http://www.deepblacklies.co.uk>

## Horrors of Hurricane Andrew

[This letter was sent to author k.t. Frankovich, who forwarded it to us for publication. Ed.]

I happened to be surfing for information on hurricane Andrew, and came upon your article [see NEXUS 8/03 and our website]. I was a volunteer rescue coordinator for a coalition of humane societies interested in helping the surviving pets of hurricane Andrew survivors by taking care of them until their owners were able to do so.

I was in Cutler Ridge the day after Andrew...and I saw everything you described in your article. I tried to tell many people about the refrigerated trucks full of body bags, but was told that I must have been suffering from post-traumatic shock, and that I really didn't see what I thought I had seen.

I also saw National Guardsmen

randomly shooting and killing any living animal they came into contact with, as they had been told that any animals which survived could become contaminated with rabies.

I also saw the National Guard shoot and kill someone I believe was a migrant worker who was hysterical, much the same as you were. All I can say is that for more than 10 years I have lived with the horror I had witnessed, only to be told it never happened. Now you have changed all that.

I made three more trips to Miami from my home in central Florida to aid people I met during that first trip, and have many more horror stories that authorities have told me "never happened".

At least now I know my nightmares are more than that...they are my remembrances of an experience that will live with me forever. Thank you for what you have done for me.

## Fluorescent Lighting Problems

G'day Duncan: My family have been readers of NEXUS since its first edition, and we have been following many of these subjects for over 40 years.

Your recent article on Incandescent Light (10/04-05) missed a bit. Years ago, students in the USA were looking at employment records and noted that those who worked outdoors had a better attendance record, fewer "sickies", less marital discord, longer marriages and better overall health, fertility and work disposition. Their summary was that sunlight is great for your health and that artificial, predominantly fluorescent, lighting is bad. Why?

At about that time a researcher was looking at the hypothalamus gland in poultry, and found it had a direct reaction to sunlight and health benefits. In studies it was shown the same effect was in humans too; as a result of those studies it is now compulsory in most US states for daylight spectrum light tubes to be used in fluorescent lighting work areas, which solved the problem. This had been well known for years by aquarium owners who used that lighting to keep their aquariums healthy, it also works with terrariums. (Conversely if your fish die and

indoor plants are crook, move them away from your TV.)

All photographers know the problems of using artificial light—red from tungsten bulbs, whites and blues from most others, unless daylight tubes and 3200 K tungsten bulbs are used. We have all seen the pink-red fluoro tubes to improve the appearance of meat in butcher's shops.

A very important factor that is often unknown is that it is very common for people to become irritable when under non-daylight fluorescent tubes for long periods. I have seen very serious family discord cease when, on advice, all the tubes were changed to daylight spectrum. Any readers who have fluoro tubes should change them to daylight spectrum; there is a very real benefit.

Cheers, Gil May, Tyalgum, NSW, Australia, gilmay@coolgold.com.au

## Dangers of High-Voltage Lines

Dear Duncan: The rural communities of Tully and Innisfail in north Queensland have since 1999 been opposing the Queensland Government's desire to relocate existing high-voltage transmission lines from state forest to private freehold land.

This is no different to what is happening by stealth in other rural areas, such as near Toowoomba and the Coomera Valley on the Gold Coast.

All of these people are hard pressed to counteract such tactics in what becomes an overwhelming and all-consuming effort to save your land, your children's lives and those in your community.

I nursed by husband as he died from leukaemia in 1997, and there was then a credible wealth of information in regard to the effects of electromagnetic radiation and there is even more now.

As the coordinator of the action group preserving the rural valley wedged between World Heritage-listed reef and rainforest of north Queensland, I communicate with scientists around the world on this issue. Most notable is Professor Dennis Henshaw of Bristol University, who is a member of the UK National Radiological Protection Board and is advancing his studies of the links between lung cancer and the corona effect

**NB: Please keep letters to approx. 150 to 250 words in length. Ed.**

produced by the ionising radiation of high-voltage transmission systems.

This reminds me of an instance when I worked for the Northern Territory Electricity Commission in the mid-1980s, before I married and before I'd heard of leukaemia. Back then, when people like me complained about the effects of EMR, part of my duties was to respond. In one of the instances at the time, I recall signing confidentiality clauses to access United States electricity supply authority records which stated that the highest rates of leukaemia were attributed to the high-voltage transmission linesmen and associated personnel.

The subsequent United States Environmental Protection Agency report was not released in the late 1980s—however, all around the world, but most importantly in this so-called "Smart State" of Queensland, we are still faced with compulsory resumption of freehold land for government-owned revenue-making community infrastructure.

Even as world evidence shows a doubling of the rate of leukaemia in children at exposures above four milligauss, Australia has not reviewed the 1989 ARPANSA standards saying exposure is safe at 1,000 milligauss.

The governments have abrogated all duty of care, and pursue wealth before people's health. We, the people, are again the unwitting canaries in the coalmine.

Bonny Bauer, Tully, Qld, Australia, bonnyb@bigpond.com

## Side Effects of Specialists

Dear Duncan: Your remarks in the Editorial of NEXUS 10/04 regarding the proposed enquiry into the safety of alternative medication is a concerted effort by the medical and pharmaceutical fraternity to stamp out the ever-increasing competition. It would be more appropriate and necessary to have the government initiate an enquiry into the side effects of treatments and drugs administered by our medicos. I would like your readers to know what happened to me recently.

At Easter, I was diagnosed with prostate cancer. It was classed by the pathology laboratory as 9 on the Gleason scale and a Grade C prostate cancer. Since pathology

stated that the cancer had already spread outside the gland, surgery was not an option. The specialist put me on hormonal therapy, i.e., Androcur-100, two tablets a day, starting 17 April. On the 30 April, I saw the specialist again and he told me to see him in three months' time and have a blood test done then.

The blurb which comes with the medication gives some side effects such as tiredness and shortness of breath as the most common. I felt I could live with that, and actually did. What it also stated was that "Androcur-100 can rarely cause severe damage to your liver, resulting in jaundice, hepatitis and, in some cases, death". The specialist never even mentioned this during the consultation. I realised afterwards that I could not possibly accept the fact that he did not ask to monitor the progress of the treatment for a period of three months, so I asked my GP to have monthly blood tests done.

On 31 May, six weeks after the start of the treatment, the results of the test showed my liver was diseased. Needless to say, I immediately ceased taking the drugs. Can you imagine what would have happened to me if I had followed the "specialist's" advice and taken the medication for a further two months?

Sincerely yours, Colin Zentveld, Sydney, NSW, Australia

## Earth's Frequency Changes OK

Duncan: I read with interest your recent article [10/03] which suggested the Schumann resonance has been rising from a frequency of 7 Hz to around 11 Hz; however, I see no cause for concern.

The reason I believe this is because of the impending magnetic pole reversal. The ionosphere has a symbiotic relationship with the Earth's magnetic field. As the Earth's magnetic field weakens approaching such a pole-reversal event, the ionosphere contracts and—just as when, for instance, a pipe is shortened in a pipe organ—the resonant frequency rises.

This is not an inherently bad thing and could have a significant contribution to the evolution of our species, as DNA changes due to changing magnetic and cosmic ray exposure will be specifically enhanced during these cyclical

transitional periods in time.

Regards, Aled Long, schmal@utvinternet.com

## The Man-Made AIDS Agenda

Duncan: Though it has probably been documented before in your excellent magazine, I feel the need to put voice to some information that has conveniently slipped under the collective noses of the "conventional" media.

It has been revealed, through the declassification of top-secret military documents and the shrewd detective work of one Boyd E. Graves, JD, that the plague of the late 20th century, AIDS, was in fact man-made [see Global News, NEXUS 10/02].

The United States' Special Virus Program's 1971–1978 flowcharts, discovered by Mr Graves in 1999, detail a diabolical plot by the US military to depopulate black populations in America and Africa. The AIDS virus, then described as a "contagious cancer that selectively kills", was attached as a complement to vaccines sent to Africa and Manhattan.

This next-generation holocaust is the dark legacy of Hitler, stemming from the infamous Operation *Paperclip* in which Nazi scientists were given amnesty to work for the US military. It was undoubtedly put into action by President Nixon, whose 1969 and 1970 national security memos regarding "overpopulation" leave no doubt as to the US government's attitude towards black populations at the time.

Boyd Graves has embarked on a personal crusade to bring the individuals responsible for this atrocity to justice, time and time again bringing the case to Congress and the Supreme Court and being repeatedly turned away, the case dismissed as "frivolous".

These claims can all be verified; however, the volumes of information involved are too great for me to document here. I highly recommend that you visit <http://www.boydgraves.com> for the full story.

J.E., cloakand\_dagger@lycos.com

## Radiation from Light Ballasts

Dear NEXUS: In your article on fluorescent light (10/03), it is not made clear that high-frequency bal-

lasts generate a considerable amount of radio-frequency radiation. Extensive use of this type of lighting in schools and office buildings has become one of the most ubiquitous (but little-known) sources of electromagnetic pollution. It could be reduced by shielding, but manufacturers of light fixtures don't bother because to do so would be prohibitively expensive.

Incidentally, the EMR Association of Australia publishes a quarterly newsletter of "non-nonsense" information on health effects of EM radiation; see website <http://www.emraa.org.au>.

John Lankes, Virginia, USA

## Private Oilwells Destroyed

Dear NEXUS Magazine: In 1995, a group of men working for a US senator and the governor of Louisiana entered our south Louisiana oilfield with guns and attack dogs and began destroying our 22 oilwells—our privately owned oilwells. We were held at gunpoint while our oilwells were destroyed by bulldozers, electric pipe cutters and other types of heavy equipment. After the pumping units were knocked down, the wells themselves—all good, productive oilwells—were filled with cement.

No reason was given to us for the action, and it was all done in the face of a US federal law called RCRA (Resources Conservation and Recovery Act), which has been in place since the 1930s and was beefed up again in 1988. The federal law specifically protects all US oilwells, their owners, the ground they sit on, and everything that comes out of an oilwell which is stated in the law as "oil, gas, produced saltwater and hydrocarbon-bearing soils".

After my husband filed several lawsuits in federal court, he was murdered. I know it was the US senator who called for my husband's death. (The governor who was involved has since gone to federal prison on an unrelated charge. The senator is still in office.)

I would like to write a story for NEXUS about what happened and who did it, and I can provide a few pictures that I managed to take.

Floy Hochenedel, LA, USA

[Dear Floy: Feel free to write your amazing story and send it; hopefully I'll be able to publish it. Ed.]
